

In the Specification:

Please amend the specification as follows:

Please amend the paragraph beginning on page 8, line 17, with the following rewritten paragraph:

If, on the other hand, there is a configuration database file that is already in the memory (block 42), it is then determined whether this configuration database file is older than the read data file (block 46). If the configuration database file is not older than the read data file (block 46), it indicates that the read data file has already been added to this configuration database file at some previous time. As a result, it is unnecessary to process the read data file, and the process can reloop back to select another data file from the file list (block 38). Conversely, if the configuration database file is ~~not~~ older than the read data file (block 46), which indicates that the read file has not been processed, the data from the read data file is then replaced or inserted into the previously saved configuration database file (block 48).
